   Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         88

GENERAL INFORMATION:

APPLICANT: Sachdeva, et al.

TITLE OF INVENTION: COMPUTATIONAL METHOD FOR IDENTIFYING ADHESIN AND ADHESIN-LIKE

TITLE OF INVENTION: PROTEINS OF THERAPEUTIC POTENTIAL

FILE REFERENCE: 30853/40359A

CURRENT APPLICATION NUMBER: US/11/052,554A

CURRENT APPLICATION NUMBER: US 60/589,227

PRIOR APPLICATION NUMBER: US 60/589,227

PRIOR APPLICATION NUMBER: US 60/589,227

PRIOR APPLICATION NUMBER: IN 173/DEL/2004

PRIOR FILING DATE: 2004-02-06

RUMBER OF SEQ ID NOS: 763

GENERAL INFORMATION:
APPLICANT: Sachdeva, et al.
TITLE OF INVENTION: COMPUTATIONAL METHOD FOR IDENTIFYING ADHESIN AND ADHESIN-LIKE
TITLE OF INVENTION: PROTEINS OF THERAPEUTIC POTENTIAL
PILE REFERENCE: 30853/40359A
CURRENT PAPLICATION NUMBER: US 60/589,227
PRIOR APPLICATION NUMBER: US 60/589,227
PRIOR APPLICATION NUMBER: US 60/589,227
PRIOR APPLICATION NUMBER: IN 173/DEL/2004
PRIOR FILING DATE: 2004-07-20
PRIOR FILING DATE: 2004-02-06
NUMBER OF SEQ ID NOS: 763
SEQ ID NO 159
LENGTH: 837
TYPE: PRT
ORGANISM: Mycobacterium tuberculosis H37RV

WPI; 1998-542705/46. N-PSDB; AAV63938.

New isolated mycobacteria polypeptides and nucleic acids - used developing products for the diagnosis of or vaccination against mycobacterial infections, particularly tuberculosis. ę

Claim 1; Page 198; 163pp; English.

The present sequence represents a Mycobacterium tuberculosis protein. Products from the present invention, which describes protein fragments and nucleic acid fragments derived from M.tuberculosis, can be used in the detection of and prevention of mycobacterial infections. In particular, the proteins and nucleic acids can be used for the diagnosis of or vaccination against tuberculosis caused by M. tuberculosis, M. africanum or M. bovis

                   The invention describes a substantially pure immunogenic polypeptide fragment (I) from Mycobacterium tuberculosis that is able to evoke a protective immune response against infections by mycobacteria belonging to the tuberculosis complex. The invention provides a (I) fusion polypeptide comprising at least one polypeptide fragment (I) and at least one fusion partner; (2) a fusion polypeptide fragment comprising a T-cell epitope from M. tuberculosis protein ESAT-6, or MPT59 and a second different amino acid sequence from M. tuberculosis, and/or including a sequence which protects the first amino acid sequence from in vivo degradation or post-translational processing; (3) a nucleic acid fragment that encodes the above polypeptides. The polypeptides and nucleic acid are useful as pharmaceuticals, for diagnosis of and as antigens for vaccination against TB caused by Mycobacterium tuberculosis, africanum or

The invention relates to a novel DNA derived from a human adult brain, tonsil, hippocampus and human fetal brain and its encoded polypeptide, given in the specification. The novel DNA is useful as a diagnostic agent. The encoded polypeptide is useful as a reagent for screening pharmaceutical compounds which inhibit the biological activity of the polypeptide. A gene containing the novel DNA is useful as a probe for diagnosing the increased expression of damage, mutation or expression reduction in the human DNA. This sequence represents the protein derive from a novel human DNA sequence used in the screening and disgnostic method of the invention. Note: This sequence is an embedded protein tal from the coding DNA shown in the sequence listing of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    previous sensitization in an animal with bacteria belonging to the tuberculosis complex. The invention also describes the use of CFP7A or CFP30A or a T-cell epitope of for the induction of a strong immune response in a mammal; use of CFP7B, CFP19 or MFT59-ESAT6 or a T-cell epitope of for diagnosis of TB in a mammal by performing a DTH type skin test; use of CFP27, CFP30A, RD1-ORF2, RD1-ORF3, RD1-ORF3, RD759-ESAT6, ESAT6-MPT59, CFP30A, CFP16, CFP19, CFP23A, CFP30B, CFP70B or a T-cell epitope of for the preparation of an immunological composition; and for the preparation of a subunit vaccine
                                                                                                                                                                                                                                 hippocampus and human fetal whole brain and encoding as gene diagnostic agent.
                                                                                                                                                                                                                                                                                                       WPI; 2003-793311/75

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ×
reticulendotheliosis viral oncogene-B Rel homology domain (RelB RHD).
The invention also relates to a method of identifying at least one test compound that alters binding of RelB RHD to the RelB-kappa-B sequence involving contacting the nucleotide sequence with the polypeptide sequence in the presence and absence of the test compound and detecting sequence of the test compound and detecting altered specific binding of the nucleotide with the polypeptide in the presence of the test compound and detecting altered specific binding of the nucleotide with the polypeptide in the presence of the test compound compared to that in the absence of the test compound that alters binding of RelB Rel homology domain (RelB RHD) with RelB-C that alters binding of RelB Rel homology domain (RelB RHD) with RelB-C nuclear factor kappa-B kinase alpha (IKK-alpha) subunit related pathologies. The isolated nucleotide segments are effectively and selectively recognized by RelB:p52 in comparison to ReaL:p50 and RelB:p50 domains. The isolated mucleotide sequence does not bind to RelB, ReaL, p50, RelB:p50, ReaL:p50 and ReaL:p50 and RelB; ReaL,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match
                                                                                                                                                                                                                                                                                                                     Isolated nucleotide sequences mediating functions of inhibitor of nuclear factor kappa-B kinase alpha subunit useful for identifying therapeutic compounds that alter the subunit related pathologies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Reticuloendotheliosis viral oncogene-B Rel homology domain; RelB nuclear factor kappa-B; NFk-B; gene expression.
                                                                                                                                                                                                                                                           The invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               158
```

The invention relates to a method of modulating a steroid receptor or a process mediated by a steroid receptor in a cell comprising administering a polypyridimine tract binding protein-associated splicing factor (PSF) polypeptide, a polypucleotide encoding a PSF polypeptide (PSF) polymucleotide), an isolated complex of a PSF polypeptide and a steroid receptor (PSF complex) and/or their agonist or antagonist. The invention also relates to a method of inhibiting transactivation domains of a steroid receptor in a cell by administering to the cell a PSF polypeptide, polymucleotide, complex, and/or their agonist, a method of stimulating transactivation domains of a steroid receptor in a cell by

a PSF polypeptide,

polynucleotide and/or a PSF

```
cc mediated by a steroid receptor or characterized by an abnormality in a condition interaction between a PSF polypeptide and a steroid receptor by cc disrupting or promoting the interaction in cells or inhibiting or promoting the activity of a PSF complex, and a method of preventing or treating a condition mediated by a steroid receptor by administering or cc promoting the activity of a PSF complex and a method of preventing or treating a condition mediated by a steroid receptor by administering a condition mediated by a steroid receptor or process mediated by a steroid receptor or characterized by an abnormality in a steroid receptor signal transduction pathway and/or an abnormality in a steroid receptor or characterized by an condition mediated by a steroid receptor or characterized by an abnormality in a steroid receptor or characterized and a steroid receptor. The methods are useful for preventing or treating a condition mediated by a steroid receptor in a subject and for evaluating a condition pathway and/or an abnormal level of interaction between a PSF polypeptide and a steroid receptor and a test substance, where the PSF polypeptide and a progesterone receptor and a test substance, where the PSF polypeptide and receptor bind to form a complex and comparing to a control in the absence of the substance to determine if the substance constrollates the onset of labor. The methods are also useful for preventing or treating a condition mediated by a subject. For preventing or treating a condition mediated by a substance to determine if the substance constrollated to the receptor and thus regulates the onset of labor. For inducing labor in a subject in a constrollate of the substance to determine if the substance constrollated by a substance to determine if the substance constrollated by a substance constrollated by a condition mediated by a substance construction in an animals, such as domestic construction in animals, such as domestic construction in animals, such as domestic construction in animals, such as
